(57) **ABSTRACT**

A new and distinct cultivar of *Gaillardia* plant named
'Baltorflam', characterized by its red/yellow-bicolor ray
florets, and vigorous, upright, and mounded growth habit.

2 Drawing Sheets

1

Latin name of genus and species of plant claimed: *Gail-*
lardia pulchella.
Variety denomination: 'Baltorflam'.

BACKGROUND OF THE INVENTION

The present invention relates to a new and distinct cultivar
of *Gaillardia* plant botanically known as *Gaillardia pulch-*
ella and hereinafter referred to by the cultivar name 'Bal-

The new cultivar originated as the product of the open-
pollination, in November 1999, of the proprietary breeding
selection designated 'NCT-137-1' (not patented) with a mix
of pollen from plants grown from Thompson & Morgan
double *Gaillardia* mix (not patented). The new *Gaillardia*
was discovered and selected as a single flowering plant
within the progeny of the above stated open-pollination
during October 2000 at Arroyo Grande, Calif.

Asexual reproduction of the new cultivar by terminal stem
cuttings taken since November 1999 at Arroyo Grande,
Calif. and West Chicago, Ill. has demonstrated that the new
cultivar reproduces true to type, with all the characteristics
as herein described, firmly fixed and retained through suc-
cessive generations of such asexual propagation.

SUMMARY OF THE INVENTION

It was repeatedly found that the cultivar of the present
invention:

1. Forms red/yellow-bicolor ray and florets, and
2. Exhibits a vigorous, upright, and mounded plant habit.

'Baltorflam' has not been observed under all possible
environmental conditions to date. Accordingly, it is possible
that the phenotype may vary somewhat with variations in the
environment such as temperature, light intensity, and day
length without, however, any variation in genotype.

'Baltorflam' is distinguished from its female parent pri-
marily in inflorescence color.

2

Of the *Gaillardia* cultivars known to the inventor the most
similar to 'Baltorflam' is 'Sundance' (not patented).
However, in side-by-side comparisons, plants of the new
cultivar differ from plants of 'Sundance' primarily in inflo-
rescence color.

BRIEF DESCRIPTION OF THE PHOTOGRAPHS

The accompanying photographs show as nearly true as it
is reasonably possible to make the same in color illustrations
of this type, typical inflorescence and foliage characteristics
of the new cultivar. The plants were grown for 12 weeks in
a greenhouse at West Chicago, Ill.

FIG. 1 illustrates the overall growth and flowering habit
of 'Baltorflam'.

FIG. 2 illustrates a single, partially opened inflorescence
of 'Baltorflam'.

FIG. 3 illustrates a fully opened inflorescence of 'Baltor-
flam'.

FIG. 4 illustrates a close-up view of a single ray floret and
leaf of 'Baltorflam'.

DETAILED BOTANICAL DESCRIPTION

The chart used in the identification of colors described
herein is The R.H.S. Colour Chart of The Royal Horticul-
tural Society, London, England 1995 edition, except where
general terms of ordinary significance are used. The color
values were determined on May 21, 2003 in West Chicago,
Ill. The readings were taken between 10:00 and 11:45 a.m.
under natural daylight conditions. The plants were produced
from cuttings taken from stock plants and were grown in a
double polycarbonate-covered greenhouse in West Chicago,
Ill. under conditions comparable to those used in commer-
cial practice. The plants were grown in 10 cm pots while
utilizing a soilless growth medium. Greenhouse tempera-
tures were maintained at approximately 65°–75° F. (18°–24°
C.) during the day and approximately 60°–65° F. (15°–18°
C.) during the night. Greenhouse light levels of 5,000–8,000

footcandles were maintained during the day. Plants were pinched at three weeks after planting. The following measurements and descriptions were taken at 12 weeks after planting of rooted cuttings.

Botanical classification: *Gaillardia pulchella* cultivar 'Baltorflam'.

Parentage:

Female parent.—Proprietary *Gaillardia pulchella* selection designated 'NCT-137-1' (not patented).

Male parent.—Mix of pollen from plants grown from Thompson & Morgan double *Gaillardia* mix (not patented).

Propagation:

Type cutting.—Terminal stem.

Time to initiate roots.—Approximately 5 to 8 days.

Time to develop roots.—Approximately 21 to 28 days.

Root description.—Fibrous and well branched.

Plant description:

General appearance and form.—Upright, mounded, and vigorous.

Crop time.—Approximately 6–7 weeks from planting of rooted cuttings.

Height from soil level to top of blooms.—Approximately 35.2 cm.

Diameter (area of spread).—Approximately 36.7 cm.

Branching habit.—Freely basal branching.

Branch description.—Quantity per plant: Approximately 3. Length: Approximately 25.1 cm. Diameter: Approximately 4 mm. Color: 146B. Texture: Smooth. Internode length: Approximately 2 cm.

Foliage.—Type: Simple. Arrangement: Opposite. Quantity per branch: Approximately 13. Venation pattern: Pinnate. Texture of upper and lower surface: Densely pubescent. Color of mature foliage: Upper surface: 137A with venation of 145C. Lower surface: Closest to 191A with venation of 145C. Upper leaves: Shape: Oblanceolate. Margin: Entire. Base: Sessile. Length: Approximately 4.2 cm. Width: Approximately 8 mm. Lower leaves: Shape: Spatulate. Margin: Pinnately lobed. Base: Sessile. Length: Approximately 4.6 cm. Width: Approximately 1.7 cm.

Flowering description:

Outdoor flowering habit.—'Baltorflam' is freely flowering under outdoor growing conditions with substantially continuous blooming from spring through fall.

Inflorescence description:

Type/appearance.—Solitary, composite, persistent. Disc and ray florets develop acropetally on a capitulum. Shape: Hemispherical.

Fragrance.—Faint, sweet.

Quantity per plant.—3 open inflorescences and 22 buds at any one time.

Size.—Diameter: Approximately 5.3 cm. Depth/height: Approximately 3.7 cm.

Receptical.—Shape: Hemispherical. Diameter: Approximately 2.4 cm. Depth/height: 5 mm.

Bud.—Shape: Oblate. Before first color: Diameter: Approximately 7.4 mm. Depth/height: Approximately 1.5 cm. Color: 151B. At first color: Diameter: Approximately 9.4 mm. Color: 13C. Depth/height: Approximately 2.3 cm. Color: 13C.

Ray florets.—Quantity: Approximately 107 per inflorescence. Shape: Funnelform with 4 free lobes. Corolla diameter: 1.3 cm. Lobe length from tube: Approximately 6 mm. Lobe width: Approximately 3 mm. Lobe apex: Pointed to slightly rounded. Lobe margin: Entire. Lobe texture: Glabrous. Color of mature lobe: Upper surface: 13A with venation of N144A. Lower surface: 13C with venation of N144A. Corolla tube: Length: 1.2 cm. Diameter at apex: 4 mm. Diameter at base: 0.7 mm. Texture: Sparsely pubescent. Color: Fully opened, outer surface: 13B at tube opening, 184A in center portion of tube length, 145C at base. Inner surface: 184A, 184A suffuses to base of lobes.

Disc florets.—Quantity: Approximately 100. Shape: Funnelform. Lobe shape: Linear. Lobe apex: Long, acuminate. Length: 7 mm. Diameter: 3 mm. Texture of corolla tube: Outer surface: Densely pubescent. Inner surface: Glabrous. Color of apex: 183B. Color of base: Colorless, transparent.

Peduncle.—Strong, erect. Length: Approximately 16.7 cm. Diameter: Approximately 1.3 mm. Texture: Densely pubescent. Color: 144A.

Phyllaries.—Quantity: Approximately 30. Shape: Lanceolate. Apex: Acute. Base: Truncate. Margin: Entire. Length: 9 mm. Width at base: 2 mm. Texture: Densely pubescent. Color of upper and lower surfaces: 138A.

Reproductive organs.—Androecium — On disc florets only. Stamen number: 4. Anther shape: Linear. Anther length: Approximately 3 mm. Anther width: Approximately 0.08 mm. Anther color: 187A. Filament length: Approximately 5 mm. Filament color: 76D. Amount of pollen: Abundant. Pollen color: 8A. Gynoecium — On disc and ray florets. Pistil length: Approximately 7 mm. Stigma shape: Narrow lanceolate, densely pubescent. Stigma length: Approximately 3 mm. Stigma color: 187A. Style length: 3.5 mm. Style color: 187D. Ovary length: 0.5 mm. Ovary color: 144D.

Seed and fruit production: Neither seed nor fruit production has been observed.

Disease and pest resistance: Resistance to pathogens or pests common to *Gaillardia* has not been observed.

Hardiness zone: 'Baltorflam' is hardy in zones nine (9) and above.

What is claimed is:

1. A new and distinct cultivar of *Gaillardia* plant named 'Baltorflam' substantially, as herein shown and described, which:

1. Forms red/yellow-bicolor ray florets, and
2. Exhibits a vigorous, upright and mounded growth habit.
